Contents

1	Computer assignment	1
1.1	General comments	1
1.2	1) Try to solve this optimization task with proper choices of size of decision variables (matrix W_1 , matrix W_2 , and vector w_3) using GD, perturbed GD, SGD, SVRG, and block coordinate descent. For the SGD method, you may use the mini-batch version.	2
1.3	2) Compare these solvers in terms complexity of hyper-parameter tuning, convergence time, convergence rate, and memory requirement	2

1 Computer assignment

1.1 General comments

- Good use of Python notebooks to make the solution and results easy to follow.

[¶]klasseg@kth.se

- Good that you not only solved the problem but also explored different implementations.
- Good that you separated the problem of cleaning and training into two notebooks.

1.2 1) Try to solve this optimization task with proper choices of size of decision variables (matrix W_1 , matrix W_2 , and vector w_3) using GD, perturbed GD, SGD, SVRG, and block coordinate descent. For the SGD method, you may use the mini-batch version.

- GD, SGD, PGD, SVRG and BCD are all implemented correctly.
- Good reuse of code for SGD, PGD, and BCD.
- Is there a motivation behind the choice of hyperparameters? For example, why does SVRG have different layers than the rest?

1.3 2) Compare these solvers in terms complexity of hyper-parameter tuning, convergence time, convergence rate, and memory requirement

- The solvers are all compared w.r.t the properties.
- In general, there could be a bit more explanation, e.g., why does BCD have a low memory requirement?
- Why does PGD require as expensive memory management as GD? In the code, the memory requirement of PGD appears to be equivalent to that of SGD.
